

Green Procurement Policy

Due to extremely high consumption of resources and energy in the world today, arising from population of each country and their inconsiderate waste disposal, and its likelihood to surge continuously, hazardous waste, the release of wastewater into public body rails and air pollution emissions from fuel combustion in industry to the atmosphere are indeed inevitable consequences. Undoubtedly, these, in turn, culminate in climate variation and the loss of ecological balance which can further cause people's quality of life and standard of living to dwindle significantly. A concrete example of such is allergies.

For that reasons, purchasing and administration department has placed a great emphasis on the importance of altering its policies and practices in procurement to be in harmony with the firm's Corporate Social Responsibility, especially in corporate environmental responsibility towards the community. In doing so, the department of purchasing and administration will focus on the following procurement procedures.

1. Select products and services that result in less environmental impact than other products of the same type.
2. Consider the life cycle of products and services since the process of obtaining raw materials, transportation, use and disposal from use.
3. Support the use of products that are environmentally friendly such as products that are certified green label.
4. Select sellers and service providers that are awarded with environmental standards first.
5. Undertake procedures that ensure the justice and fairness of relationship within the organization.

All of these procedures are addressed to express the company's responsibility towards mankind in this world, hoping they can live safely and disease free in good environment with the high quality of life forever.
